

People who have been aided by HBOT

Although HBOT is not officially recognized as a form of treatment, it can be an effective adjunctive therapy, which has already helped many people. Health experts agree with those who have felt its effects themselves or have witnessed “hyperbaric miracles,” that this in fact is the case.

On Total Health Magazine website are gathered testimonies of people who have witnessed how hyperbaric oxygen therapy really does make a difference.

Dr. Edgar End, Clinical Professor of Environmental Medicine at the Medical College of Wisconsin, shared: “I’ve seen partially paralyzed people half carried into the HBOT chamber, and they walk out after the first treatment. If we got to these people quickly, we could prevent a great deal of damage.”

One of the advocates of such treatments is also Dr. Dr. Russell Kolbo, from Mt. Rainier Clinic for Wholistic Rejuvenation in Gig Harbor, Washington, who wrote: “I have personally and professionally witnessed the amazing results after HBOT. My wife had a stroke—within 56 hours I had her in the HBOT chamber; I credit HBOT as the major facilitator in her cognitive recovery and clearing of two major heart vessels blocked at 80 percent, which returned to 100 percent flow within four months; she was off all prescriptive medications within two months. Additionally, I’ve witnessed the amazing behavioral improvements in autistic children as well as in patients with wounds unresponsive to conventional therapies.”

Technician’s story

The people who see it all up close and personal are hyperbaric technicians. On the Total Health Magazine website they spoke to Tammy, a technician with the Mt. Rainier Clinic in Gig Harbor, Washington:

“A child of approximately five months of age was born healthy. At age six months, the mother was bathing her and the phone rang; she left the infant for a few seconds to answer the phone. In that time, the infant submerged in water and experienced what physicians diagnosed as irreversible brain damage. The parents did not know about HBOT and didn’t bring the child for therapy until one year of age; the child was totally non-responsive—in a vegetative state. After the second dive, [a session is referred to as a dive] the child began tracking with her eyes. After approximately 12 dives, she began rolling-over on her own and making independent movements. Improvement continued but the family was from out of the country and I cannot report on the overall outcome.”

She shared two other stories, which you can read [here](#) or by following the link under References.
